Education

University of Glasgow & UESTC 2021/09 – 2025/06 (expected)
B. Sc. in Electrical and Electronic Engineering Chengdu, China

- Teaching Assistant for *Introductory Programming* (2022 Fall)
- Major GPA: 93.6/100
- Relevant Course (Self-study):
  - Computer Architecture and Engineering — Berkeley CS152/252A
  - Introduction to Computer Systems — CMU 15-213
  - Algorithms I/II — Prof. Robert Sedgewick, Princeton
  - Digital Design & Computer Architecture — Prof. Onur Mutlu, ETH Zürich
  - Circuits and Systems — Prof. Ali Hajimiri, Caltech
  - Introduction to Machine Learning — CMU 10-301/601

Experience

Individual Research Project 2023/02 – Present
Research Collaboration Remote

- **Following up** on the FlashAttention, to accelerate the training of Transformers by quantificationally modeling the intra-accelerator data movement and reducing it.
- **Assist & Collaborated with** Dr. Yu Zeng

Individual Research Project 2022/10 – 2023/01
Research Collaboration Remote

- **Simulation Acceleration.** Implemented the method of compiler optimization on the synthesis of RTL netlist to generate reduced as well as cycle-accurate RTL code.
- **Experiment.** Compared the simulation time of the original RTL code and the optimized RTL code, and the result shows that the reduced RTL code can save 2x simulation time. Haven tested on multiple designs, including CPU core, deep-learning accelerator, floating point compute unit, and general purpose GPU.
- **Assist & Collaborated with** Dr. Yu Zeng

Chinese Academy of Science, "One Core for Life" Project 2022/08 – 2022/10
Hardware Engineer Remote

- **Designed a RISC-V 64IM CPU core** with 5-stage pipeline and 3 levels of cache, using CHISEL. Fixed bugs in the design and passed all the tests in the RISC-V compliance test suite.
- **Built Simulation Framework** for the core, based on Verilator and C++. Inspired by GEM5, the framework can simulate the core with a core-state monitor and user program.
- **Verified the Design** on ICE40UP5k FPGA, using *icestorm* toolchain.

Institute of Fundamental and Frontier Sciences, UESTC 2022/03 – 2022/07
Research Intern Chengdu, Sichuan

- **Built a 2-D Material-based Transistor** using the PDMS-assisted dry separation method. The transistor consisted of MoS_2 as the drain, BN as the insulating layer and Graphene as the gate.
- **Measured and Analysed** its electrical properties, including the drain current, the gate voltage, and the drain voltage.

Skills

Programming

- C/C++, Scala, Python, Rust, Bash, Java
- PyTorch, Triton, CUDA

Hardware Design

- Verilog, Chisel, Vivado HLS
- Vivado, Icestorm, Verilator, Icarus Verilog

Platforms and Tools

- GNU/Linux, KVM/QEMU, Windows/WSL2

Language

- English (GRE 321+4, CET-6 645/710), Chinese (native)

Certifications

Machine Learning with Python 2022, Summer
freeCodeBootcamp Remote

Personal Projects

Yosys-script A Visual Studio Code language support for Yosys script.
NEMU A full-stack RISC-V emulator implemented in C/C++
NeoVim Config My NeoVim config implemented in Lua
